

What is a wind power generating system (DFIG)?

Wind power-generating systems are one of the clean energy sources, with variable speed and constant frequency being the most widely utilized in DFIGs, which is made up of a wind turbine, a gearbox, an induction motor, and control modules.

Why do wind turbines use DFIG?

Because the power electronics only process the rotor power, typically less than 25% of the overall output power, the DFIG offers the advantages of speed control with reduced cost and power losses. This PLECS demo model demonstrates a grid-connected wind turbine system using all of PLECS' physical modeling domains.

What makes DFIGs unique in wind power systems?

The ability of these converters to control both active and reactive power makes DFIGs unique in wind power systems. DFIG-based systems also contribute to grid stability and voltage control, which is increasingly significant as wind energy integration progresses.

How does DFIG control wind energy?

However, wind energy poses challenges such as rapid fluctuations in frequency and voltage stability [9,10]. DFIG-based systems incorporate advanced control strategies to maintain operation during grid fluctuations, such as Low Voltage Ride Through (LVRT), which helps avoid disconnection from the grid during voltage dips [11,12].

Wind power generation system is increasing day by day. The DFIG's principle of working as an induction generator with a multiphase wound rotor and a multiphase slip ring ...

DFIG, or doubly fed induction generator, is defined as a type of AC generator with a wound rotor that is commonly used in high-power applications, where the rotor is supplied with balanced ...

This paper presents an IoT-based real-time data collection method for analyzing the performance of the Wind Power Generation System (WPGS) using an intelligent IoT ...

The DFIG system applied to wind power generation has gained considerable academic attention and industrial application during the past 10 years. In practical applications, ...

Under situations of unbalanced grid voltage, this study aims to explore the efficacy of the Direct Power Control (DPC) approach in managing wind turbine systems based on DFIG.

Abo-Khalil AG, Alghamdi AS, Eltamaly AM, Al-Saud MS, Praveen PR, Sayed K (2019) Design of state feedback current controller for fast synchronization of DFIG in wind ...

Back-to-back converters are widely using in DFIG based system for wind power applications to produce morepower output. Depending upon the decoupled control strategy ...

Abstract The overall efficiency of the DFIG is superior when it is working close to the rated operating point and rated flux level. However, in light loads, optimal efficiency requires ...

The theoretical results in 2 Establishment of a wind power generation system and mathematical modeling, 3 Modal analysis of a full-order DFIG-based WECS indicate that the ...

The doubly-fed induction generator (DFIG) wind power system based on virtual synchronous generator (VSG) has been widely concerned because of its advantages of ...

This paper presents the control strategies and performance analysis of doubly fed induction generator (DFIG) for grid-connected wind energy conversion system (WECS). The ...

Control of DFIG-based wind power generation system under unbalanced grid voltage conditions May 2024 Natural and Applied Sciences International Journal (NASIJ) 5 ...

This work accords to the field of renewable energy by presenting an effective control strategy for DFIG-based wind energy systems, highlighting the potential of advanced ...

An integrated energy system is produced when solar photovoltaic panels are incorporated into a wind power system based on DFIG's DC connection of the (beta t beta) ...

DFIG-based WECS are widely used in wind power generation due to their advantages, such as high efficiency, low cost, and flexible control. However, DFIG-based ...

A comprehensive MATLAB/Simulink implementation of a Doubly-Fed Induction Generator (DFIG) wind power system with integrated energy storage, featuring advanced ...
